What is tailwind

Tailwind is a utility first css framework which generates simple atomic classes, so you can style apps quickly without sacrificing *much* customizability

Looking at this makes me feel ill

If you can suppress the urge to retch long enough to give it a chance, I really think you'll wonder how you ever worked with CSS any other way.

Common issues with tailwind

That is an extreme example, but lets look at some issues with tailwind

- Classlist gets long and hard to read
- Hard to reuse code

Keem's experience

Great

1. James is Tailwind God and he bestowed his blessing upon us
2. SPEED - instant gratification
3. UTILITY - Padding, hover states, custom components

Not so great

1. How much is too much?
2. Still need css modules in specific cases - Layouts

 Before After

After

Grid areas are still are not available, instead use For Layouts we would still use SCSS modules to setup, since we can defined Grid Areas by name
